

# Job Search Web Application

ANANYA WALIA

ananyawalia17@gmail.com

## Overview

Job Search is a web app built to help blue collar workers to find jobs post the pandemic.

## Goals

1. Job Seekers can search for suitable jobs.
2. Employers can post jobs that have openings in their company.

## Technologies Used

### Spring Boot

(java-based framework used to create micro services)

### PostgreSQL

(object-relational database system)

### Postman

(collaboration platform for API development)

### DataGrip

(database management environment to query, create and manage databases)

### React

(front end, JavaScript library for building user interfaces or UI components)

## Future Scope

Due to the limited time frame, the following features were thought of but not implemented in the application.

### I. Recommendations

Based on the analysis of job seeker's details and applied jobs, notifications can be sent whenever a suitable job is posted.

### II. Applying to multiple jobs

Job seekers can apply to multiple jobs that are filtered on the basis of his requirements with one click.

### III. Multiple languages

The UI can be displayed in the language chosen by the blue collar worker.

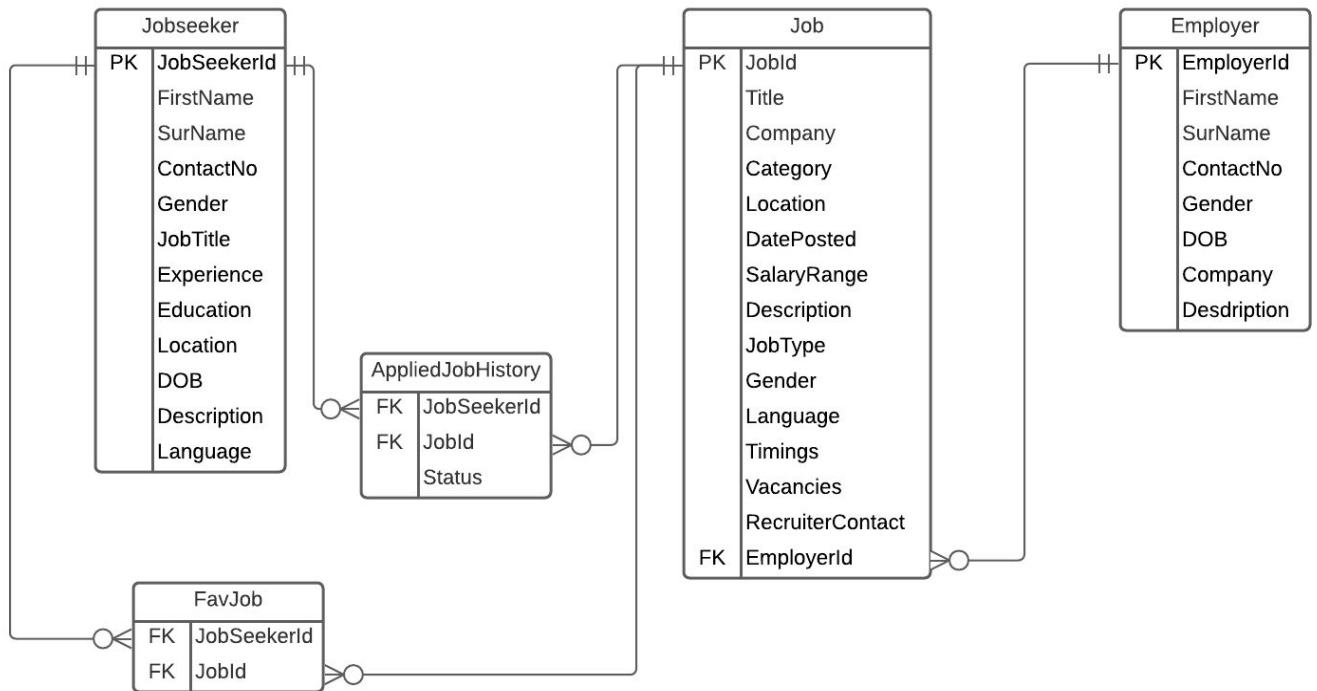

### IV. Favourite Jobs

Job seekers can add jobs to their favourites section to apply later on.

### V. Registration Authentication

Registration and login can be secured using spring security.
